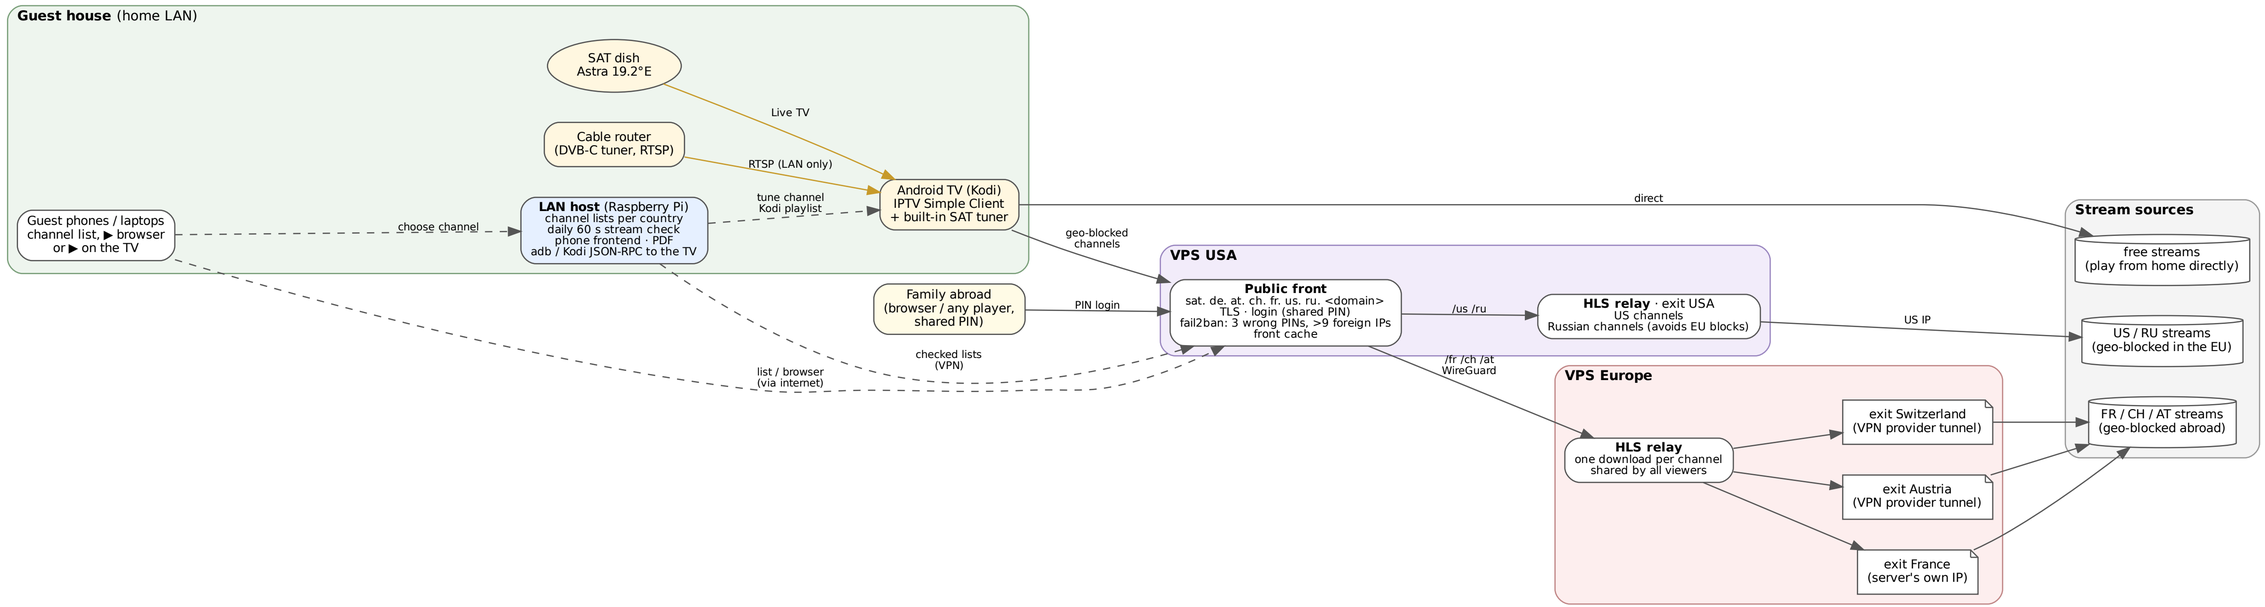
**VPS federation for a guest house TV**

each server covers the geo-blocks of its region · one upstream stream per channel · guests choose on their phone

**How it works**

1. The LAN host builds one channel list per country and checks every stream daily.
2. Free and cable channels play directly at home - no server involved.
3. Geo-blocked channels go to the relay whose exit sits in the right country.
4. The relay downloads each segment once and shares it with every viewer.
5. Add a region = add a VPS (or VPN exit) + one relay route.


Note: public performance / geo rights - check licensing before commercial use.
